                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a specifically claimed Apo B 100 binding CC site peptide analogue which can be used as a component of a non-competent low density lipoprotein (LDL) CC particle of the present invention. The LDL particle comprises at least 1 creptor and at least 1 lipophilic substituent. Also described in the CC invention are peptides containing an apo B binding sequence with at least 1 CC dimers. Non-naturally occurring, receptor-competent LDL particles are cell call that express an apo B protein for delivering anticancer drugs to CC cancer cells that express an apo B protein receptor, and (ii) additives and CC cocurring, receptor-competent LDL particles are CC cocurring, receptor-competent LDL particles are CC cocurring, receptor-competent LDL particles are cell culture media especially as growth supplements. Non-naturally CC apo B sequence, which is large and tends to aggregate, to provide binding caffinity to an apo B protein receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

The invention relates to peptides having affinity for oxidised low CC is useful in an immunoassay to determine the presence, and optionally, CC the amount of antibodies in a sample, having affinity for oxidised low CC preferably immobilised peptide is useful for measuring the amount of CC autoantibodies for oxLDL in a sample, especially a serum or plasma sample CC crom a patient for evaluating the risk of coronary heart diseases, and several other disorders such as CC endothelial dysfunction. The peptide of the invention is stable, can be blood, and has a long half-life. The present sequence is human apoB-100 xxx
Sequence 34 AA;
                                                                                                                                                                                                                                                                             Claim 6; Page 5; 21pp; English.
                                                                                                                                                                                                                                                                                                         New peptide useful in enzyme immunoassays for detecting oxidized low density lipoprotein which is a marker of coronary heart disease and other cardiovascular diseases, has affinity for oxidized low density
                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2002-179777/23.

AAW64587 and AAW64588 are fragments of human apolipoprotein which are used with Factor V protein fragments in a novel method to detect the presence of a mutated protein in a sample that may also contain the corresponding wild-type protein. The method is used to detect mutations that alter protein functions (either point mutation or small insertions or deletions), particularly in proteins involved in blood coagulation or metabolism of fat. Protein functions which are specially detectable are the Leyden mutation in factor V (associated with increased risk of deep vein thrombosis), mutations in apolipoprotein (apo) genes (certain alleles of apoE indicates increased risk of developing Alzheimer's disease), thermostable 5.10-methylenetestrahydrofolate reductase (associated with hypercysteinaemia and venous thrombosis) and factor VII mutations (associated with increased risk of cardiovascular disease). The
                                                                                                                                                                                                                                                                                                                                                         Detecting or quantifying mu comprises reaction with lig factors or apolipoproteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         apolipoprotein B-100 (apoB-100). ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density lipoprotein (IDL), low density lipoproteins (LDL) and lipoprotein a. The present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in vitro, for expressing a therapeutic polypeptide or antisense molecule (or ribozyme). Specifically they are used for gene therapy of cancers (particularly non-small cell lung carcinoma), diabetes, cystic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Factor V; human; detection; protein function; blood coagulation; apo; fat metabolism; Leyden mutation; deep vein thrombosis; apolipoprotein; Alzheimer's disease; 5,10-methylenetetrahydrofolate reductase; prion; hypercysteinaemia; factor VII; cardiovascular disease; pathogen; virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 apolipoprotein of verv-1

                       AAW96827-77 represent nucleic acid binding domains derived from human apolipoprotein B-100 (apoB-100). ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density lipoprotein (IDL), low density lipoproteins ((LDL) and lipoprotein a. The present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in vitro, for expressing a therapeutic polypeptide or antisense molecule (or ribozyme). Specifically they are used for gene therapy of cancers (particularly non-small cell lung carcinoma), diabetes, cystic fibrosis and arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     method can also be applied to proteins from pathogens, e.g. viruses or prions. The method does not require complex apparatus for polymerase chain reactions, it is simple, standardisable and reliable and is particularly suited to routine screening. It also allows mutant protein in a sample to be quantified
                                                                                                                                                                                                                                                                       Composition comprising nucleic acid bound used for delivering nucleic acid to cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    δ
                    25-FEB-2003
                                                                    ABG52504;
                                                                                              ABG52504 standard; peptide; 343 AA
                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          04-FEB-2000; 2000US-0180312P.

(C stringency to a nucleic acid molecule expressed in the human adult liver. (C in samples derived from human adult liver. The genes identified may be used for predicting, measuring and displaying gene expression c in samples derived from human adult liver. The genes identified may be hyperlipoproteinaemia, hyperlipidaemia such as cirrhossis, c samples derived in yearlipidaemia and hypercholesterolaemia which is c associated with coronary heart disease.                                                                                                CC AAQ89633 and AAR72704 depict the AA sequence of human apo B-100 and its CC corresp. cDNA, from AA residue 3214 through residue 3590 according to the CC numbering scheme of Ludwig et al., DNA, 6:363 (1987). Ludwig et al.
CC reported the full cDNA sequence for the human apo B-100 gene, consisting of 29 exons. AAQ89633 corresp. to nts 9642-10770. The apo B-100 cDNA cc segment in AAQ89633 encodes an apo B-100 polypeptide called 89. Other CC truncated AA sequences and cDNA sequences of apo B-100 identified in the CC disclosure are: No. N terminus C terminus AA nt AA nt 81 3429 10287 3510 (10530 82 3418 10254 3510 10530 83 3386 10158 3510 10530 84 3353 10059 CC 10530 82 3418 10287 3523 10569 86 3429 10287 3544 10632 87 3429 CC 10287 3565 10695 88 3429 10287 3590 10770 89 3214 9642 3590 10770 Forward CC (F) and reverse (R) primers that can be used to generate a cDNA segment CC coding for the above fragments are given in AAQ86935- AAQ86944. A CC polypeptide is claimed which includes residues 217-297 and which CC immunoreacts with antibodies generated by the hybridoma MB47 having ATCC CACcession No. HB 8746. Claimed polypeptides are listed in RT. A fusion CC CAAQ89634/R72705) and a sequence of apo B-100

                                                                                                                                                                                                                                                                                               The inventors claim a portion of the polypeptide contg. apo B-100 that immunoreacts with antibodies secreted by the hybridoma MB47 having ATCC Accession No. 8746. Polypeptides specifically claimed include residues 217-297, 216-310, 216-331, 216-352, 216-377, 1-377, 205-297, 173-297, 140-297. DNA sequences encoding the polypeptides are also claimed. Also claimed are a fusion polypolypeptide that contains: (a) a first maino acid residue sequence up to 250 residues in length that includes residues 120-135 of apo A-I, (b) a second amino acid residue sequence up to 375 residues in length that includes residues 217-297 of apo B-100 and DNA encoding it. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.)

Hepatocellular carcinoma; marker; human; apolipoprotein B; diagnosis

Human apolipoprotein B, marker for hepatocellular carcinoma.

œ

```
CC The present sequence is that of human apolipoprotein B. This non-cell CC associated protein is one of a set of proteins characterised as associated protein is one of a set of proteins characterised as CC diagnostic targets for hepatocellular carcinoma (HCC). Such proteins are CC the products of genes identified by expression microarray analysis of CC tumour samples from hepatitis C virus (HCV) infected patients with HCC as CC infected cirrhotic non-tumour tissue and normal liver. The invention CC relates to the detection of HCC by assaying patient samples such as CC tissue, plasma, serum, etc. for the presence and level of specific HCC CC proteins. A finding of elevated levels of one or more of these CC proteins in a patient sample indicates that the patient has HCC. Methods CC and scanning methods that employ non-cell-associated and cell-associated xxx

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 B 80

```

```
A; Molecule type: mRNA
A; Residues: 2169-2179 < HOS>
A; Note: the sequence shown represents the carboxyl end of apolipoprotein B-48
A; Note: two RNA species, 14.1kb and 7.5kb in length, were isolated from the human

Halbert GW, Owens MD, Baillie ດ

WPI; 1998-230637/20.

Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells that express this receptor.

Claim 12; Page 52; 73pp; English.

The present sequence represents a specifically claimed Apo B binding site peptide which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KAEYKKNKHRH (1) or TTRLTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring,

```
The present sequence represents a specifically claimed Apo B 100 binding CC Site peptide analogue which can be used as a component of a non-
CC naturally occurring, receptor-competent low density lipoprotein (LDL)
CC particle of the present invention. The LDL particle comprises at least 1
CC peptide component that has at least 1 binding site for an apo B protein
CC invention are peptides containing an apo B binding sequence with at least
CC dimers. Mon-naturally occurring, receptor-competent LDL particles are
CC dimers. Mon-naturally occurring, receptor-competent LDL particles are
CC cancer cells that express an apo B protein receptor and (ii) additive to a sequence, which is large and tends to aggregate, to provide binding
CC apo B sequence, which is large and tends to aggregate, to provide binding
CC affinity to an apo B protein receptor and (ii) additive to an apo B protein receptor and (ii) additive to an apo B protein receptor and (ii) additive to apo B sequence, which is large and tends to aggregate, to provide binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           뭐

CC The present sequence is an analogue of apoprotein B 100. The peptide, CC which has Ly85 conjugated with malondialehyde (MDA), inhibits uptake of CC apoprotein B-based low density lipoprotein (LDL) (or partly modified CC arberosclerosis. Atherosclerosis in treatment and diagnosis, especially for CC atherosclerosis. Atherosclerosis is characterised by thickening and its CC degeneration of the arterial intima by, firstly, the formation of fatty CC plaques within the artery. Foam cells and, secondly, the formation of fibrous CC oxidised LDL by macrophages via a scavenger receptor, which causes cells cc to take up more cholesterol than necessary via the high affinity LDL cc epitopes which prevent oxidised LDL from being taken up by the scavenger coptor, so preventing LDL uptake by the high affinity LDL receptor, and CC possibly preventing LDL uptake by the high affinity LDL receptor, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 3

                                                                                                                                                                                             The invention relates to bone strength and mineralisation regulatory protein (BSMR) and its corresponding nucleic acid sequence. BSMR DNA is useful for the diagnosis or therapy of osteoporosis and for regulating (increasing) bone strength and mineralisation in a human subject by activating bone density regulating transmembrane receptor (BSMR protein). An expression vector comprising a promoter that is operably linked to BSMR DNA is useful for modulating bone density and for enhancing bone strength and mineralisation in a mammal cell. Composition comprising a BSMR effector is useful for treating osteoporosis and is useful particularly as a coating for prosthetic devices and surgical implants. BSMR is useful for screening lead pharmaceutical agents as BSMR effectors, which may be used to treat a range of eye disorders such as diabetic retinopathy, hypertensive retinopathy and retinopathy of prematurity, in which mormal vascular growth and integrity of ocular control of the strength and retinopathy.
                                                                                                                                                                                prematurity, in which vessels is disrupted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bone strength and mineralisation regulatory protein; BSMR; bone strength; mineralisation; ophthalmological; antidiabetic; bone density regulating transmembrane receptor; prosthetic device; surgical implant; diabetic retinopathy; hypertensive retinopathy; therapy; opteoporosis; prematurity; ocular vessel; eye disorder;

                                                                                          The invention describes a molecule (I) inhibiting uptake by the high CC affinity low density lipoprotein (LDL) receptor of LDL or its partially CC modified form. (I) And an antibody (II) that binds (I) are useful in the CC manufacture of a medicament for inhibiting uptake by the high affinity CC LDL receptor of LDL or a partially modified form of it. (I) And (II) are CC useful in the diagnostic test for oxidised LDL, or antibody specific CC against oxidised LDL, which will cause uptake by the high affinity LDL CC or (II) with a sample; (b) detecting an antibody-antigen binding reaction CC; and (C) correlating the detection of the antibody-antigen binding CC reaction with the presence of oxidised LDL, or antibody specific against CC oxidised LDL, which will cause uptake by the high affinity LDL receptor CC of LDL or a partially modified form of it. (I) Is useful as an immunogen, CC e.g., for the production of antibodies, and particularly in the treatment CC and diagnosis of atherosclerosis. (I) And (II) are useful as reagents in CC diagnostic tests, and for preventing foam cell formation. This is the combibit uptake of the high affinity low density lipoprotein B 100 used to combibit uptake of the high affinity low density lipoprotein (LDL) by the

                                                                                                                                                                                                                                                                                CC The invention relates to a molecule comprising one of three fully defined complished is conjugated with malondialdehyde (MDA) and inhibits uptake by the high affinity low density lipoprotein (LDL) receptor or its partially modified form. The molecule is useful for treatment or diagnosis of the CC inhibiting uptake by the high affinity LDLR or its partially cCC form. The molecule is useful for treatment or diagnosis of the CC gpecific against oxidised LDL or oxidised LDL or its partially modified cause uptake by the high affinity LDLR or its partially modified CC The molecules of the High affinity LDLR or its partially modified cause uptake by the high affinity LDLR or its partially modified condenses and antibodies are for diagnosting and treating which will atherosclerosis. The present sequence represents a human apolipoprotein B

It has the CC insertions or substitutions, while retaining anti-coagulant properties of CC apolipoprotein B-100 (apoB-100). Z1-KAQ-X1-KXQKHHHS-X2-T-Z2 (I) X1 = S (X) X2 = T or I; Z1 = the N terminus of the peptide, or 1-47 amino acids CC (aa); Z2 = the C terminus of the peptide, a terminal amide group or 1-77 cases and controlled the controlled or controlled or sequential treatment of cancer, particularly to prevent CC processes, specifically to prevent or reduce blood coagulation (e.g. thibit amgiogenesis, cellular differentiation or apoptosis. KRAD-14, cc citvation of the prothrombinase complex; and prevents active as such or as part of a 9s-aa peptide, inhibits CC inhibit amgiogenesis, cellular differentiation or apoptosis. KRAD-14, cc contration of the prothrombinase complex; and prevents active as such or the spart of a 9s-aa peptide, inhibits of a store as such or thromboplastin and of platelets by thromboin. XX semilar than apoB-100, they act more quickly
